

Information Technology on the Move: Technical and Behavioural Evaluations of Mobile Telecommunications (Wiley Series in Communication and Distributed Systems)

With the increasing congestion of roads, there is now a need for traffic information which is current, accurate and specific to the needs of the individual driver. By applying the developments in information technology to the problem of road management, road transport informatics (RTI) can provide such data. This volume details the latest R&D in those IT systems which can be used to aid traffic mobility and safety. Focusing upon the topical area of mobile communications, the authors cover the key concepts and issues of RTI, including the recent technical developments in search techniques, radio messaging and radio data systems.
